WADA YASUHIRO****(54) PRODUCTION OF ALDEHYDES****(57) Abstract:**

PROBLEM TO BE SOLVED: To enable the suppression of side reactions and produce aldehydes in high selectivity, etc., for straight-chain isomers by carrying out a hydroformylating reaction of an olefinic compound in the presence of a group VIII metal using a phosphonite compound having a specific structure as a ligand.

SOLUTION: (B) An olefinic compound is reacted with carbon monoxide and hydrogen in the presence of (A) a catalyst containing a group VIII metal (especially preferably rhodium) and an acyclic phosphonite compound of formula I [X, Y and Z are each a (substituted)hydrocarbon] to afford the corresponding aldehyde. The phosphonite compound is used in an amount selected from the range of preferably 0.1-200mol in the component A. For example, a compound of formula II is cited as the compound of formula I.
